

# Charge Distribution dependency on gap thickness of CMS endcap RPC

Sung Park, KODEL, Korea Univ  
On behalf of the CMS RPC group

1. Motivation
2. Measurement of charges in 6 different gap thickness
3. Conclusion

The present detector R&D is for future CMS RPCs at high backgrounds

✓ In PHASE II upslope, we need new endcap RPCs in  $1.6 < |\eta| < 2.1(2.4)$  by 2023.

RPCs in high- $\eta$  to be developed in the phase II

## Direction of R & Ds for high- $\eta$ CMS RPCs (at RE3/1 and RE4/1)

### Higher rate capability can be achieved if

- ✓ Lower resistivity of electrode → **Rate capability**  $\sim 1/\rho$
- ✓ Use smaller avalanche **charges** with a lower digitization **threshold**
  - Better for reducing the probability of aging due to high-rate background
  - **To guarantee the longevity of the RPC gaps**

### For threshold dependency with large size chambers (Kyongsei's talk)

- 1) Double gap with 1.6mm gas gap thickness
- 2) Multigap 4 gaps with 0.8mm gas gap thickness

### For charge dependency with small size chambers:

- 1) Six double gaps with 0.2mm steps from 2.0mm to 1.0mm

# Six RPCs at KODEL

Six RPCs with different gap thickness:  
1.0, 1.2, 1.4, 1.6, 1.8, 2.0 mm

# Operation of 6 Gaps

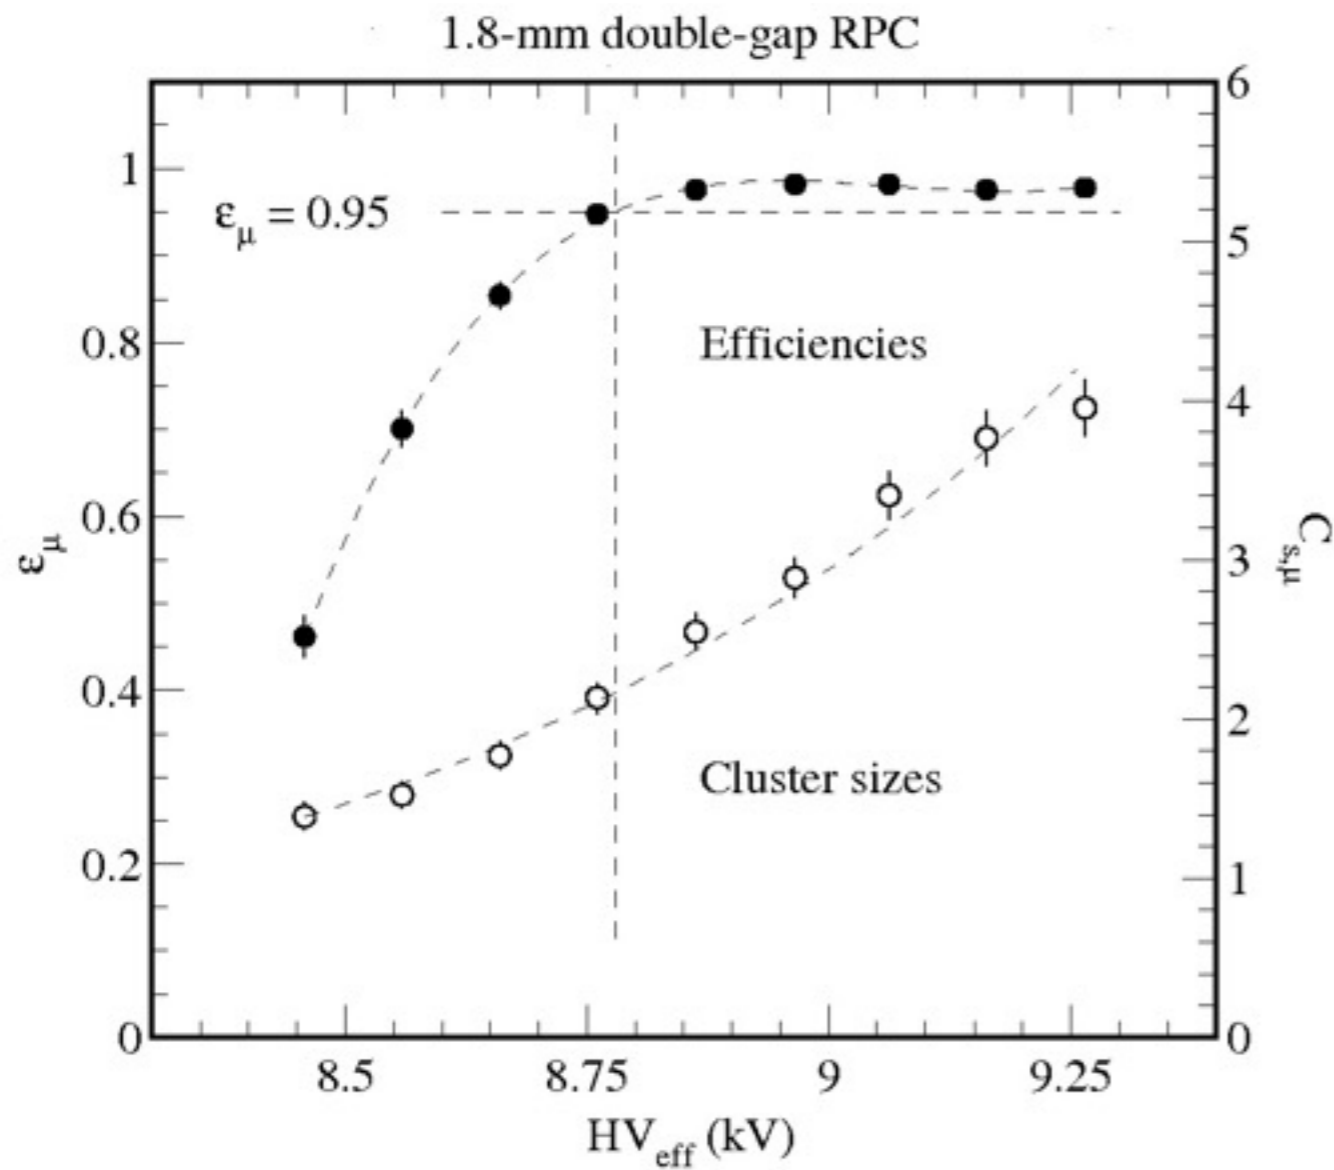

- 1 Efficiency & Cluster size of each gap thickness
- 2 H.V & E-field vs. gap thickness
- 3 Charge distribution of each gap thickness
- 4 Models for charge distributions

# Efficiency in 2.0mm

|                   | H.V(kV) |
|-------------------|---------|
| <b>Eff 50%</b>    | 9.17    |
| <b>Eff&gt;95%</b> | 9.39    |

# Efficiency in 1.8mm

|                   | H.V(kV) |
|-------------------|---------|
| <b>Eff 50%</b>    | 8.47    |
| <b>Eff&gt;95%</b> | 8.78    |

# Efficiency in 1.6mm

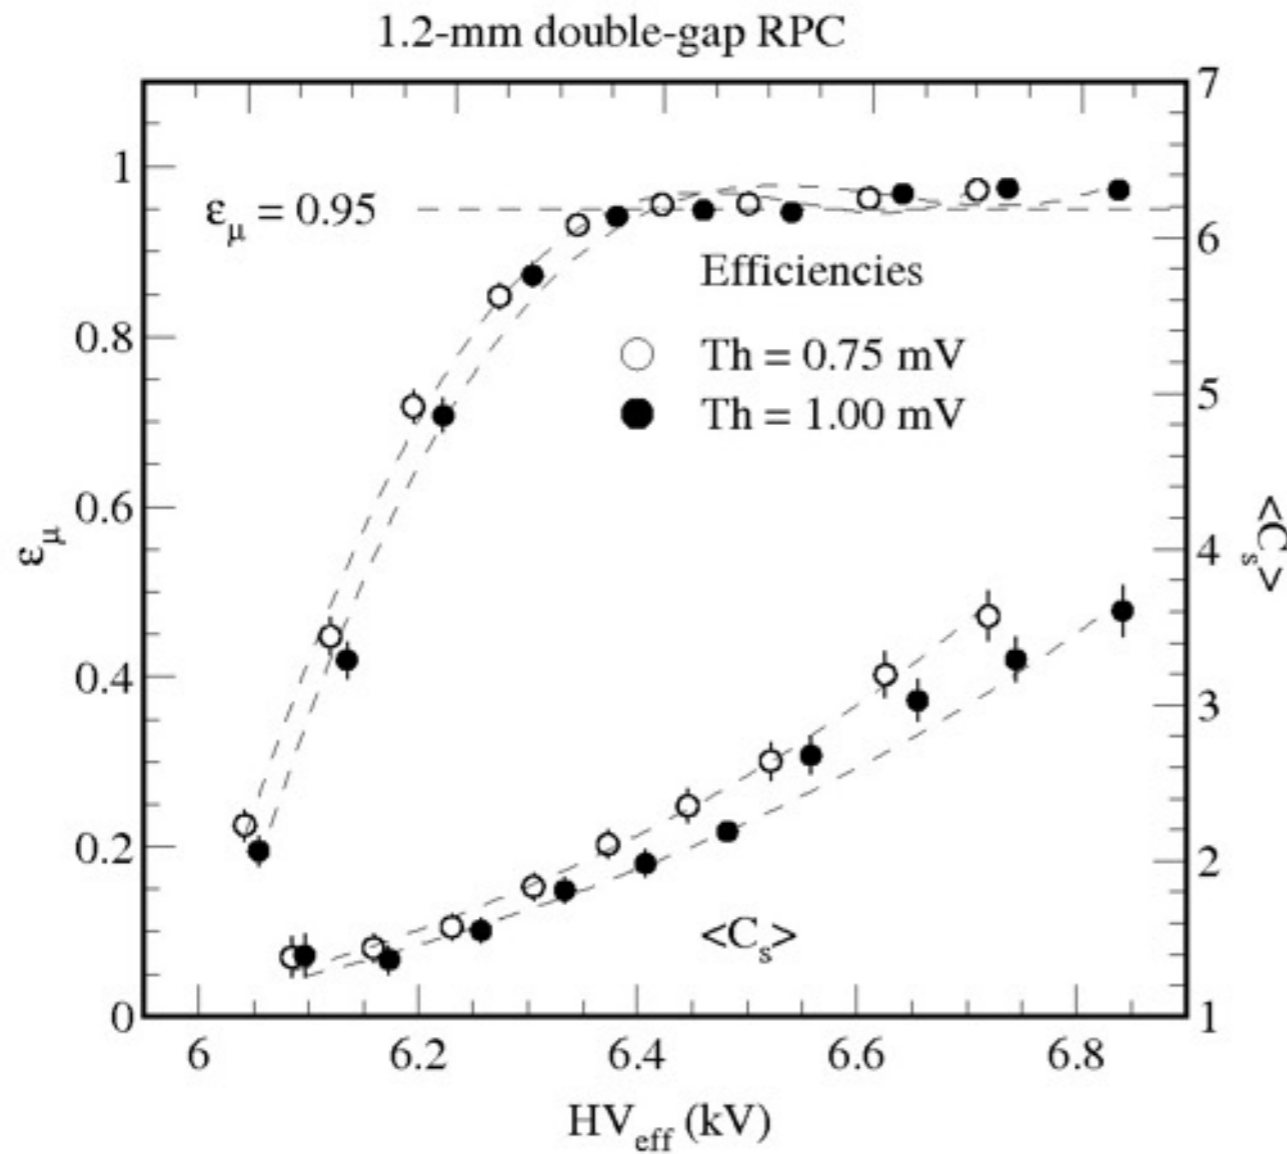

|           | H.V(kV) |
|-----------|---------|
| Eff 50%   | 7.71    |
| Eff > 95% | 7.99    |

# Efficiency in 1.4mm

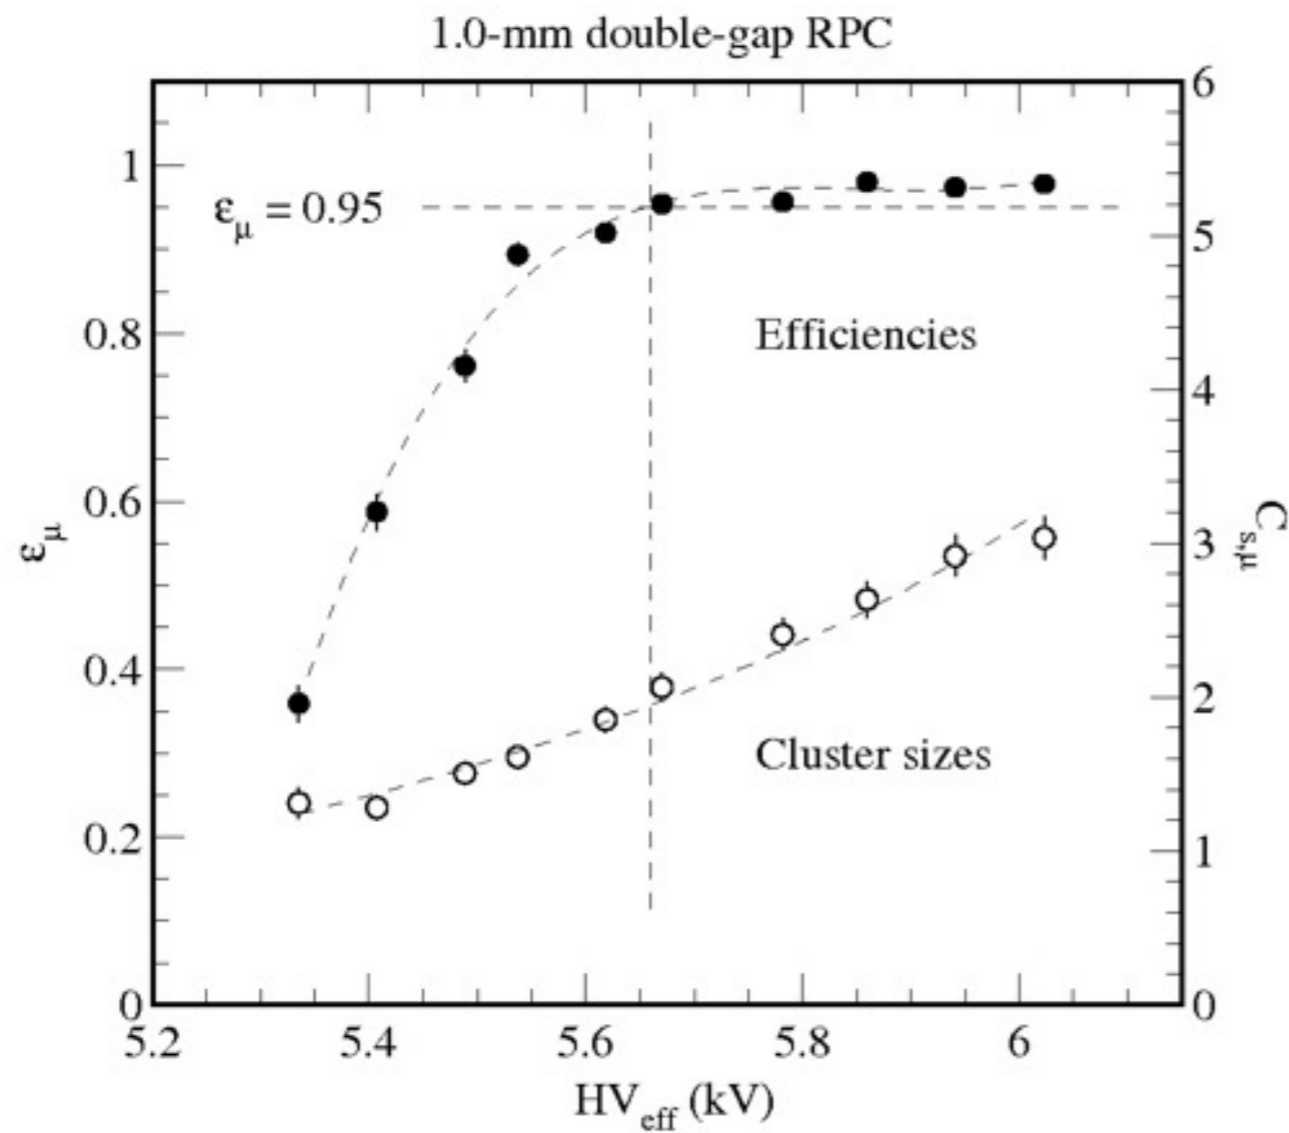

|         | H.V(kV) |
|---------|---------|
| Eff 50% | 6.94    |
| Eff>95% | 7.21    |

# Efficiency in 1.2mm

|         | H.V(kV) |
|---------|---------|
| Eff 50% | 6.16    |
| Eff>95% | 6.50    |

# Efficiency in 1.0mm

|                   | H.V(kV) |
|-------------------|---------|
| <b>Eff 50%</b>    | 5.38    |
| <b>Eff&gt;95%</b> | 5.66    |

# H.V vs. gap size

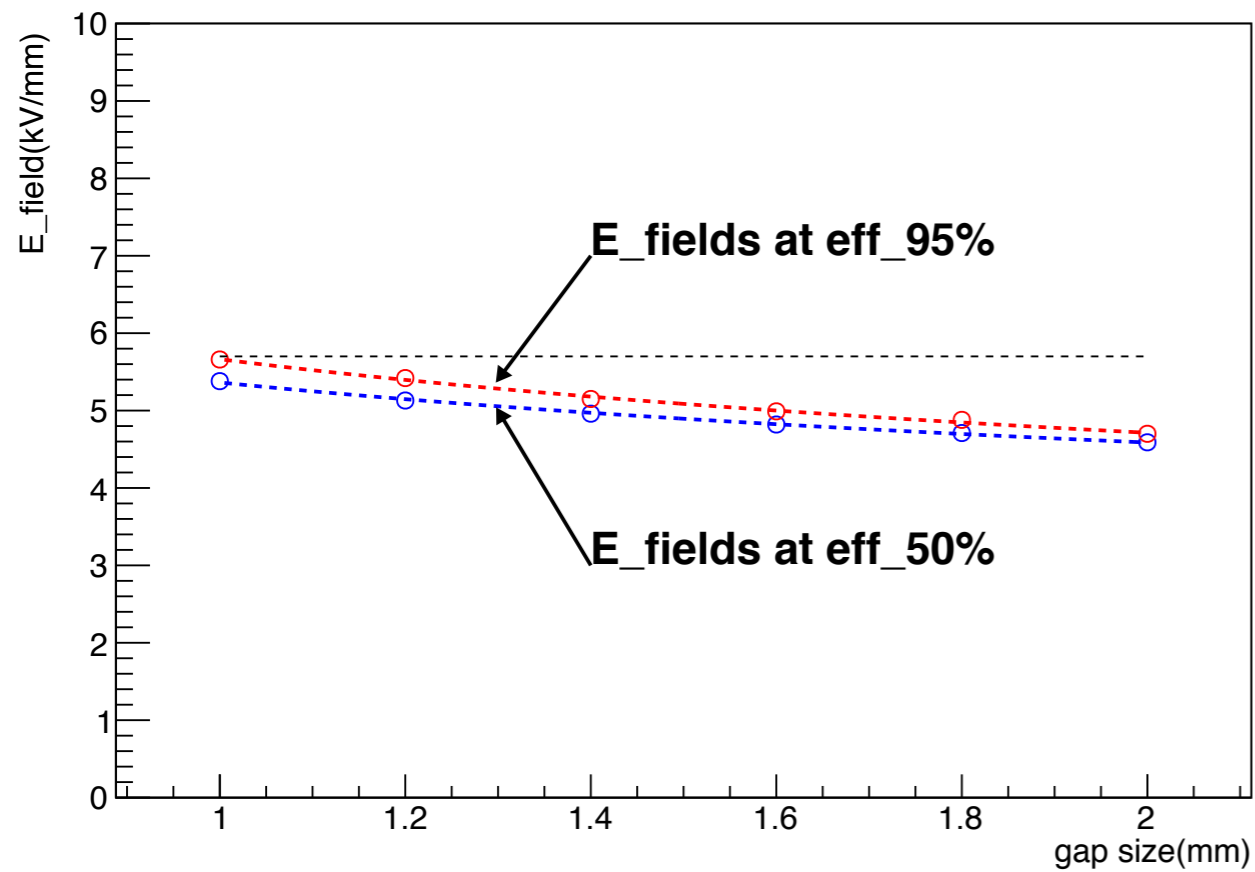

H.V vs. gas gap size

| gap(mm) | H.V_50%(kV) | H.V_95%(kV) |
|---------|-------------|-------------|
| 1.0     | 5.38        | 5.66        |
| 1.2     | 6.16        | 6.50        |
| 1.4     | 6.94        | 7.21        |
| 1.6     | 7.71        | 7.99        |
| 1.8     | 8.47        | 8.78        |
| 2.0     | 9.17        | 9.39        |

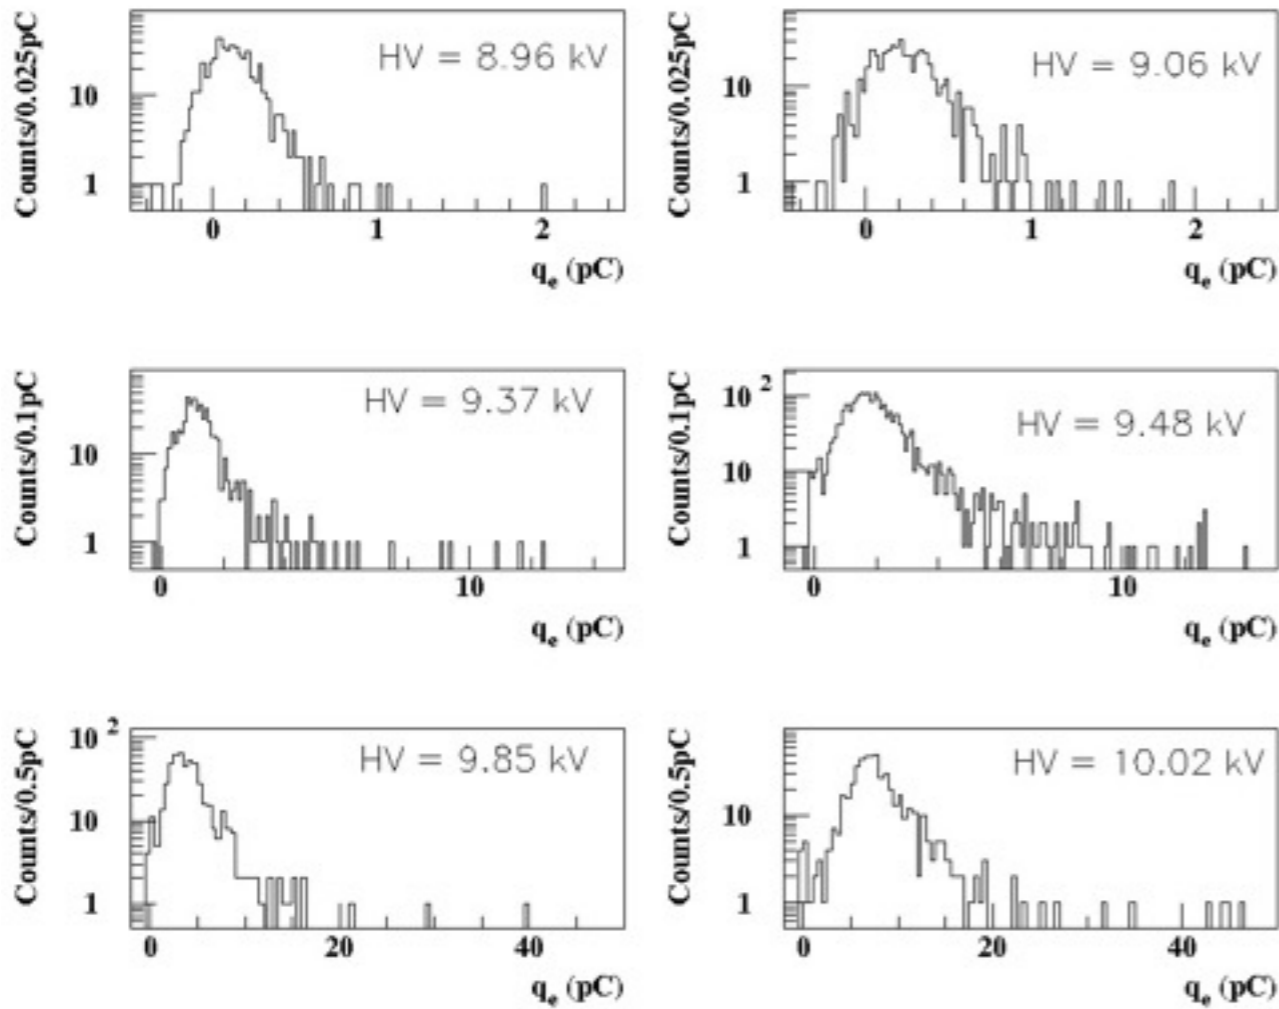

# E\_field vs. gap size

E\_field vs. gap size

| gap(mm) | E_fields@50% (kV/mm) | E_fields@95% (kV/mm) |
|---------|----------------------|----------------------|
| 1.0     | 5.38                 | 5.66                 |
| 1.2     | 5.13                 | 5.42                 |
| 1.4     | 4.96                 | 5.15                 |
| 1.6     | 4.82                 | 4.99                 |
| 1.8     | 4.71                 | 4.88                 |
| 2.0     | 4.59                 | 4.70                 |

# Charge distribution of 1.0mm gap fitting w the logistic function's cumulative

## Summary of charge distributions

| Gap (mm) | H.V_95%(kV)<br>Th(1.0mV) | $\langle q_e \rangle$ (pC) | V_0(kV)<br>in logistic fun. |
|----------|--------------------------|----------------------------|-----------------------------|
| 2.0      | 9.39                     | 1.658 $\pm$ 0.108          | 9.36                        |
| 1.8      | 8.77                     | 1.621 $\pm$ 0.072          | 8.80                        |
| 1.6      | 7.99                     | 1.607 $\pm$ 0.080          | 7.91                        |
| 1.4      | 7.21                     | 1.473 $\pm$ 0.069          | 7.05                        |
| 1.2      | 6.50                     | 1.448 $\pm$ 0.049<br>(94%) | 6.36                        |
| 1.0      | 5.66                     | 1.423 $\pm$ 0.079          | 5.62                        |

# Conclusion

1. Charge distribution dependency on gap size behaves as expected
2. Charge growing exponentially fast at lower E-fields, slow at saturated higher E-fields.
3. Charge distribution indicates threshold setting
4. A smaller avalanche charge can be obtained by a lower threshold, allowing to lower H.V.
5. Fit of charge distribution  $\langle q_e \rangle$  with logistic fun. performed
6. Further works in progress
